

Utah-Buenos Aires Grid for Chemical Physics: NMR Chemical Shifts, Genetic Algorithms and Growth Pattern Formation in Thin-layer Cells.

Marta B. Ferraro

Departamento de Física, FCEyN, Universidad de Buenos Aires, Argentina.

Guillermo Marshall

Laboratorio de Sistemas Complejos-Departamento de Computación,
FCEN, Universidad de Buenos Aires, Argentina

and

Julio C. Facelli

Center for High Performance Computing, University of Utah, Salt Lake City,
Utah.

This project is partially funded by the NSF International and Chemistry Divisions
under grant INT-0071032 and by grants from University of Buenos Aires (UBACYT-
X098), and CONICET (Argentina).

Departamento de Física Juan José Giambalaj

What are Chemical Shifts ?

- Are the “shift” of the NMR signal due to the molecular and crystalline environment.
- Tensorial quantity, i.e. the shifts depends on the orientation of the molecule in the magnetic field.

FACULTAD DE CIENCIAS EXACTAS Y NATURALES

Departamento de Física Juan José Giambaglì

Why Chemical Shift Calculations are Important ?

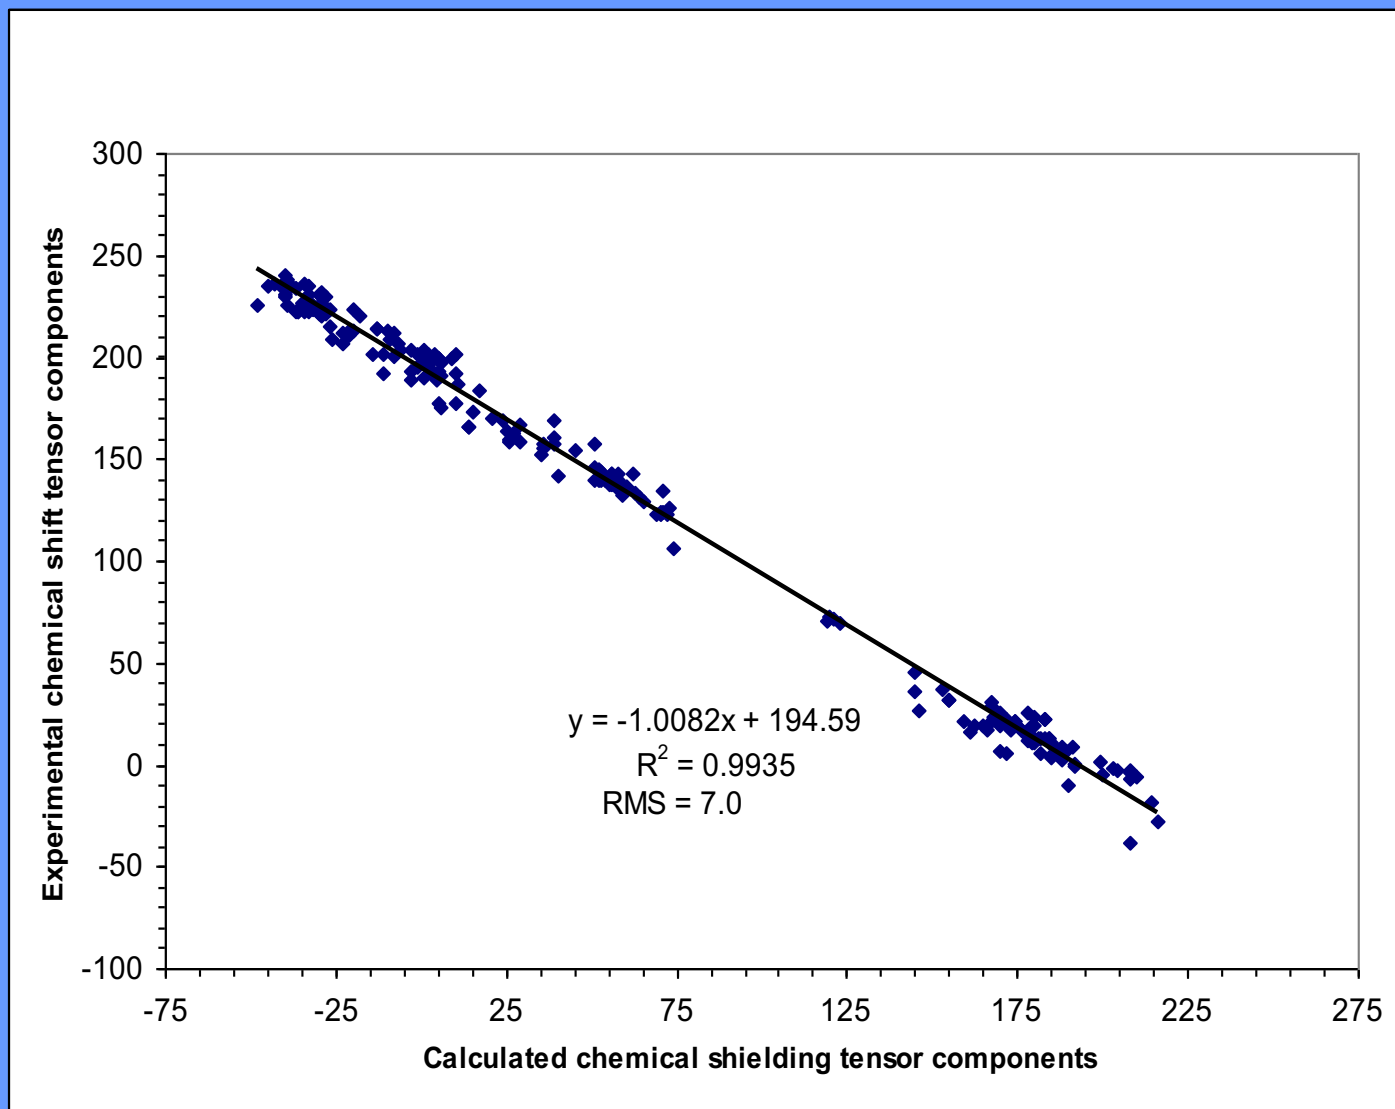

- Chemical shifts are highly dependent of Molecular and Crystalline Structure.
- Chemical Shifts Calculations provide the link between “structure” and “measurements”

Genetic Algorithms

- Minimization methods based in the Darwinian principle of survival of the fittest.
- Genetic algorithms can provide not only a global minimum, but also information on other states with energies or properties close to the minimum.
- Genetic Algorithms are amenable to efficient parallelization and Grid computing.

Departamento de Física Juan José Giambaglì

Modified Genetic Algorithm to Model Crystal Structures

- Proved very effective for rigid molecules.
- It has been modified to use empirical potentials for flexible molecules.
- Will be adapted to use experimental and calculated NMR chemical shifts information in the optimization method.

MGAC : Modified Genetic Algorithm for Crystal and Cluster Structures

The code was run on Linux-Cluster
with 12/300 nodes.

Growth Pattern Formation in thin-layer cells

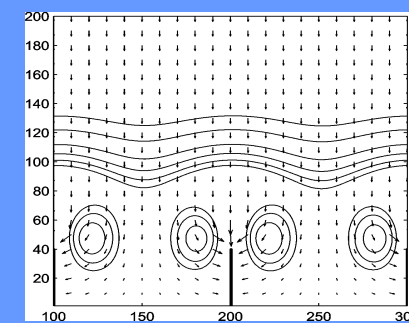

- Growth pattern formation (GPF) is a common phenomenon in a wide range of problems from physics to biology.
- The interpretation of these measurements require numerical simulations of macroscopic model recently developed.

Objectives of the Collaboration

- Leverage expertise and resources available in Utah and Buenos Aires
- Develop robust computational techniques to allow these compute intensive Chemical Physical applications to take advantage of inter-continental Grid resources.
- Develop an student training program in computational chemical physics with emphasis in Grid Computing.

UNIVERSIDAD DE BUENOS AIRES

FACULTAD DE CIENCIAS EXACTAS Y NATURALES

Departamento de Física Juan José Giambalaj

Combine resources in the Buenos Aires and Utah groups

- Buenos Aires:
- Theoretical expertise on chemical shifts
- Programing capabilities

- Utah:
- Large computational resources
- Experimental NMR Lab.

Network Needs

- **End-to-end connectivity from FCEyN to CHPC for:**
- Remote access to systems via Globus like infrastructure.
- Efficient file sharing, including pre-staging.
- Distributed scheduling of processing and data staging.

Network Needs (cont.)

- I2 type of services from FCEyN to CHPC
 - Teleconferencing,
 - Distributed white boards and
 - Remote instrument operation
