Introduction

The purpose of this report is to demonstrate the benefits of the StarLight link to both US FedNet participants and AMPATH international participants. The data analysis that follows will make evident a heavy usage by US FedNets and Latin American National Research and Education Networks (NRENs) connecting to AMPATH. The StarLight link is crucial in order to enable research traffic to flow between US Federal Networks (FedNets) AMPATH international participants since the Abilene Acceptable Use Policy (AUP) does not permit the transit of international traffic over Abilene to FedNets.

The current Gigabit link infrastructure handles IP, IPv6 and multicast traffic and since its inception in late January has seen usage in excess of 4.3 Terabits per second (Tbps), an average of 733 Gigabits per second (Gbps) a month. With this type of usage it is safe to say the AMPATH StarLight link is a well established route of exchanging information between US FedNets and international peer networks.

Background

The AMericasPATH (AMPATH) network is an FIU project sponsored in part by the US National Science Foundation CISE directorate, in collaboration with Global Crossing (GC) and other telecommunications product and service providers. Using Global Crossing's terrestrial and submarine optical-fiber networks, AMPATH is interconnecting the research and education (R&E) networks in South and Central America and the Caribbean to US and non-US R&E networks via Internet2's Abilene network and the StarLight International Exchange Point.

The purpose of the AMPATH project is to allow participating countries to contribute to the research and development of applications for the advancement of Internet technologies. The mission of AMPATH is to serve as the pathway for Research and Education Networking in the Americas and to the World and to be the International Exchange Point for Latin America and the Caribbean R&E networks. Additionally AMPATH fosters collaboration for grand challenge e-Science and Educational Outreach to underserved populations both in the US and abroad.

The AMPATH pathway provides the 'bridging link' between Central and South America participant countries and the world's R&E networks. It is with this express purpose that the StarLight/STARTAP infrastructure was established. StarLight, the optical STAR TAP, is an advanced optical infrastructure and proving ground for network services optimized for high-performance applications¹. The Science, Technology, And Research Transit Access Point, or *STAR TAP*, is a persistent infrastructure also funded by the National Science Foundation to facilitate the long-term interconnection and interoperability of advanced international networking. *STAR TAP* exists in support of applications, performance measuring and technology evaluations and connects with the Ameritech Network Access Point (NAP) in Chicago, enabling network traffic to flow to international collaborators from over 150 U.S. leading-edge research universities, institutions, and supercomputing centers.

Methodology

The data was collected using Cisco IOS's Sampled NetFlow feature on AMPATH's GSR 12012 router. Sample data was collected at intervals of 1 week each on two occasions; two one-day observations were also made. The first set was collected May 16th through May 22nd; the second set of data was collected June 1st through June 8th. Two more observations were made during June 24th and June 25th. These data sets not only cover two different months but also different time spans during both months. Information was collected purposely on non-overlapping dates to ensure that applications or regularly scheduled transfers from research centers would not affect our readings.

NetFlow is an accounting mechanism that is able to capture a large set of traffic statistics which include protocol, port, etc. These data sets can be further analyzed for purposes of planning, accounting, billing or network analysis. For this particular research project we used NetFlow to obtain readings of incoming and outgoing traffic from our AMPATH / StarLight link. Two distinct NetFlow commands were used.

First, to apply an input filter to the interface in order to gather the necessary data we used the NetFlow command:

```
flow-cat *filename* | flow-filter -I 62 | flow-stat -f9 -S2 | more
```

This command gives NetFlow the SNMP number of the interface which we want to analyze (in this case 62). For the output traffic analysis the NetFlow command:

```
flow-cat *filename* | flow-filter -i 62 | flow-stat -f9 -S2 | more
```

was used. Notice that in both of these commands we have omitted the true filenames of our observation in order to demonstrate that the various naming schemes can be in place. All NetFlow would need is the appropriate filename for the time period in which the observations are taking place.

Router configuration is also a crucial piece of the research taking place, since it is the router that samples the traffic that will later be analyzed. In our particular case AMPATH's router is configured for:

```
ip flow-export version 5  
ip flow-sampling-mode packet-interval 100
```

From the above configuration we see that NetFlow v5 is being used; however, the most telling configuration aspect above is the sampling mode which looks at only 1 out of 100 packets. This interval allows for accurate traffic accounting while maintaining a safe CPU level. Sampled NetFlow allows network administrators not to have to look at every single switched packet, which can become challenging (if at all possible) at the high switching rates of this particular Cisco 12000 series router. There is one very important thing to keep in mind: when looking at the statistics for this interface, since the traffic was sampled at an interval of 1 out of 100 packets, the traffic figures should be multiplied by a factor of 100 once the analysis has been completed.

Not accounting for ‘true traffic’ will result in severely underestimated figures, which can have a definite impact on the research being carried out. One more convenient NetFlow feature is that it exports the sampled data from each configured interface to a destination specified on the router. In our case:

ip flow-export destination 131.94.191.101 2058

The above IP address resolves to a FreeBSD UNIX system that listens on port 2058 for incoming NetFlow exports from different devices on campus. The directory in which the data resides is located at: /raid/netflow/flows/gsr.ampath.net

Using these tools we are confident our data set represents an accurate record of traffic through the AMPATH StarLight link.

Traffic Accounting & Participant Analysis

With the information provided from NetFlow, we were able to find the IP addresses from each of our top daily users. All IP addresses are registered to their corresponding institutions and each one of these registrations also carries with it the pertinent contact information for each network. The contact information was obtained using a simple ‘whois’ command.

If during the course of our NetFlow analysis we obtained the IP 131.94.128.2 as one of the top daily users we would then proceed to find the information about this network/host using the following UNIX command:

whois 131.94.128.2@whois.arin.net

The above command queries a WHOIS server hosted by ARIN (American Registry for Internet Number) and returns information relevant to our study such as institution name, network block assigned and contact information for either network administrators or a Network Operations Center (NOC) that might be hosted by the participant institution. During the course of our study we found that not only was ARIN involved but also since hosts from all around the globe send traffic through this interface we had to query other registries. LACNIC (Latin America), APNIC (Asia-Pacific) among others were registries which we had to utilize in order to find the contact information for our participants.

After obtaining contact information for each participant shown on the NetFlow data, a formal letter was sent to each participant network explaining the purpose of our research project and how their participation in this research activity will help to ensure continued research and education along with advanced network connectivity. In the letter we also asked that they visit a website in which some questions pertinent to our research would be asked. A separate letter *and* site was designed in Spanish, specifically for those users who would be more comfortable with Spanish than the original English version.

The English URL is:

http://www.florida.edu/ampath/application_info_req.asp

The Spanish URL is:

http://www.florida.edu/ampath/application_info_req_esp.asp

Both of these sites contain a brief survey form with specific questions regarding the nature of the research that participant institutions are undertaking. One such example of a question that can be found in our survey asked these institutions which other research networks they are currently peering with. This helped us discover where traffic/data from this particular user was going after connecting through the StarLight/AMPATH link. Another question asked was for specific contact person and contact information for that particular research institution. This helped us obtain another form of communication with our peer research networks other than the e-mail extracted from the simple ‘whois’ command issued based on the ‘NetFlow’ data.

Behind both of these ASP forms an MS-Access database will hold all submissions. With this database, we are able to receive data submitted by our users and utilize this information to further assist us with follow-up for this project.

Data Observations:

In the most in-depth part of our report, we were able to analyze the data obtained into two distinct sets. The first set, which we will call ‘first observation’, refers to a one-week span, more specifically the third week in May 2003. Having used the NetFlow tool to obtain the IPs of the top 30 daily users for this period we created a set of seven MS Excel spreadsheets. Each one of these documents lists the top 30 users sorted by amount of bandwidth-utilized daily.

Having used the ‘whois’ UNIX command as previously described to gather information about each network, we were able to construct detailed tables describing the daily usage. Each daily table contains not only the IP of the member network connecting through AMPATH but also the name of the particular institution that the IP range is registered to. This way we were able to easily identify not only the participating universities and research centers but also aggregate to the national level. During data analysis of our first observation three different sections were considered. The first was the total amount of bandwidth used by the top 30 daily users; usually in Gigabytes. The second set that we considered was the usage totals by country (i.e. – Argentina 305 Mb), this helped set the stage for the final set of numbers which became evident; these were the percentage utilization of each member network during the period chosen for data analysis.

As an example, during May 16, our first day of observation, the total usage was a combined 9.7 Gigabytes. Brazil occupied the top spot with 72.9% of this total bandwidth; next the University of Puerto Rico used 9.8% of the total bandwidth and next followed FIU, Chile (REUNA) and Argentina (RETINA) with 10.7%, 9.8% and 3.4% respectively. The following are the rest of the daily figures that we gathered at the conclusion of each observation: **

May 17th 2003:

<i>Total Usage</i>	<i>7,128,429,500</i>
<i>Usage by Country:</i>	
<i>Brazil</i>	<i>4,253,255,400</i>
<i>Chile</i>	<i>935,003,500</i>
<i>UPR</i>	<i>1,059,761,200</i>

<i>Argentina</i>	<i>0.0%</i>
<i>FIU</i>	<i>11.3%</i>
<i>NASA</i>	<i>0.0%</i>

An In-Depth Look At AMPATH StarLight Traffic Accounting and Participant Analysis

May 21st, 2003:

<i>Total Usage</i>	11,023,778,000
<i>Usage by Country:</i>	
Brazil	8,665,916,300
Chile	747,051,300
UPR	1,080,695,500
Argentina	0
FIU	787,581,000
NASA	0
<i>Usage Breakdown:</i>	
Brazil	78.60%
Chile	6.80%
UPR	9.80%
Argentina	0.00%
FIU	7.10%
NASA	0.00%

May 22nd 2003:

<i>Total Usage</i>	6,724,536,800
<i>Usage by Country:</i>	
Brazil	4,626,194,600
Chile	490,556,000
UPR	1,282,814,400
Argentina	0
FIU	324,971,800
NASA	0
<i>Usage Breakdown:</i>	
Brazil	68.8%
Chile	7.3%
UPR	19.1%
Argentina	0.0%
FIU	4.8%
NASA	0.0%

****Note:** Since Brazil, Chile and Argentina had multiple institutions on the top 30 user list we made the decision to aggregate these into one country. Any time we refer to these countries we are really citing the multiple institutions that are connecting to Internet2 within the country.

As we can see from our data observations, universities and centers transmitting data to AMPATH from South America upstream to the different FedNets have a large bandwidth footprint. On an average during this data collection period the top 30 hosts sent 9.645 Gigabytes of data! Brazil was the heaviest user by far, representing on an average 61.2% of all traffic. UPR was second with 17.1% of daily traffic on an average. These two were followed by REUNA (Chile 13.5%); FIU (5.92%) and NASA/Ames Research Center (0 .78%) along with RETINA (0.68%).

Our second observation consisted of analyzing not a half-duplex traffic situation as before, where only traffic being received from South American member networks was analyzed; but instead all traffic being sent and received by this link. The effect of studying traffic being received from StarLight was as expected, a fairly large collection of US FedNets and also international networks that frequent the AMPATH/StarLight link.

This second set of data was obtained during the first week of June, this was a time purposely chosen so that we could obtain data from non-overlapping weeks in different months. Traffic was analyzed in the same way as in the first observation, only this time our data samples were larger since we included all traffic across the StarLight router interface. Again we built tables with the particular IPs and names of those top 30 users

using the link; this time however, there was a slight difference in the analysis. Instead of breaking down traffic figures by countries as before, we decided to concentrate on the aggregate bandwidth being utilized by all top 30 daily hosts.

That approach yielded interesting results; and these are listed in our next table.

	Traffic (US FedNets and Beyond)	Traffic (South Am. Member Nets)
June 1st	3,761,375,400 or 3.76 Gb	5,419,593,100 bytes or 5.42 Gb
June 2nd	16,276,361,200 or 16.28 Gb	16,723,112,700 bytes or 16.72 Gb
June 3rd	14,711,981,300 or 14.71 Gb	9,796,568,200 bytes or 9.79 Gb
June 4th	22,475,993,500 or 22.48 Gb	11,112,262,300 bytes or 11.11 Gb
June 5th	18,036,703,300 or 18.04 Gb	13,872,820,400 bytes or 13.88 Gb
June 6th	19,430,142,000 or 19.43 Gb	12,086,268,400 bytes or 12.1 Gb
June 7th	14,777,694,800 or 14.78 Gb	6,619,119,400 bytes or 6.62 Gb
June 8th	13,482,069,100 or 13.48 Gb	4,743,034,000 bytes or 4.74 Gb
Average Traffic:	15.37 Gb	10.05 Gb

As we can see from the above results, the traffic from the US FedNets on an average outweighs the traffic being received from South American member networks. This is a very important fact to keep in mind; it underlines the usage characteristics of the various US FedNets and beyond. Worldwide, as shown in Appendix B, where the second observation results are located, universities and research centers frequently use this link as a means for research.

Another crucial part of our research that is still ongoing seeks to gather feedback from users of these member networks. Although feedback was still being gathered at the time this report was finalized, we will make it a high priority in our near future to append to this report, or any future publications, responses we obtain from researchers who actively use this AMPATH/StarLight resource.

Current Network Layout

Please see *Appendix D* for a detailed network diagram and our current network schema. The AMPATH/StarLight link currently resides on the AMPATH GSR 12012 series, a donation from Cisco Systems, Inc. The link connecting AMPATH to Starlight is a Gigabit Ethernet link provisioned as a Layer 2 IP VPN tunnel over Global Crossing's MPLS private network. It is a Gigabit Ethernet link that is connected to StarLight via an MPLS cloud. This Layer 2 configuration permits end networks to conveniently establish bilateral peering relationships.

Conclusions / Recommendations

As is evident from the data gathered and analyzed we see a clear and consistent utilization of the AMPATH/StarLight link from US FedNets, international research organizations and universities. The extent of usage shown in the analysis of our observations warrants not only the necessary condition of a reliable link but the establishment of funding sources that will guarantee the existence of this research tool. We therefore urge such funding be obtained, but also advocate the creation of an AMPATH/StarLight network procurement/reliability group once funding has been identified. This group would be immediately responsible for overseeing the network operations aspect of the connection and would then meet regularly to discuss improvements in order to also assure continued service; meaning no single point of failure on this link. Final network design and recommendations would be given to the appropriate entity and the network restructured to provide realization of this goal.

Total Usage 6,724,536,800 bytes (6.72 Gb)

Usage by Country:

Brazil	4,626,194,600 bytes (4.63 Gb)
Chile	490,556,000 bytes (490 Mb)
UPR	1,282,814,400 bytes (1.28 Gb)
Argentina	0 bytes
FIU	324,971,800 bytes (325 Mb)
NASA	0 bytes

Usage Breakdown:

Brazil	68.8%
Chile	7.3%
UPR	19.1%
Argentina	0.0%
FIU	4.8%
NASA	0.0%

An In-Depth Look At AMPATH StarLight Traffic Accounting and Participant Analysis

This represents only the usage numbers and percentage breakdown for the top 30 users on this link for this particular time frame. We extend this assumption to the rest of the traffic and assert that it is safe to assume that the rest of traffic will look like this.

Appendix B: 2nd Observation of Traffic from US FedNets and Beyond to AMPATH Member Networks

June 1st, 2003
